1. Data formats used in NGS

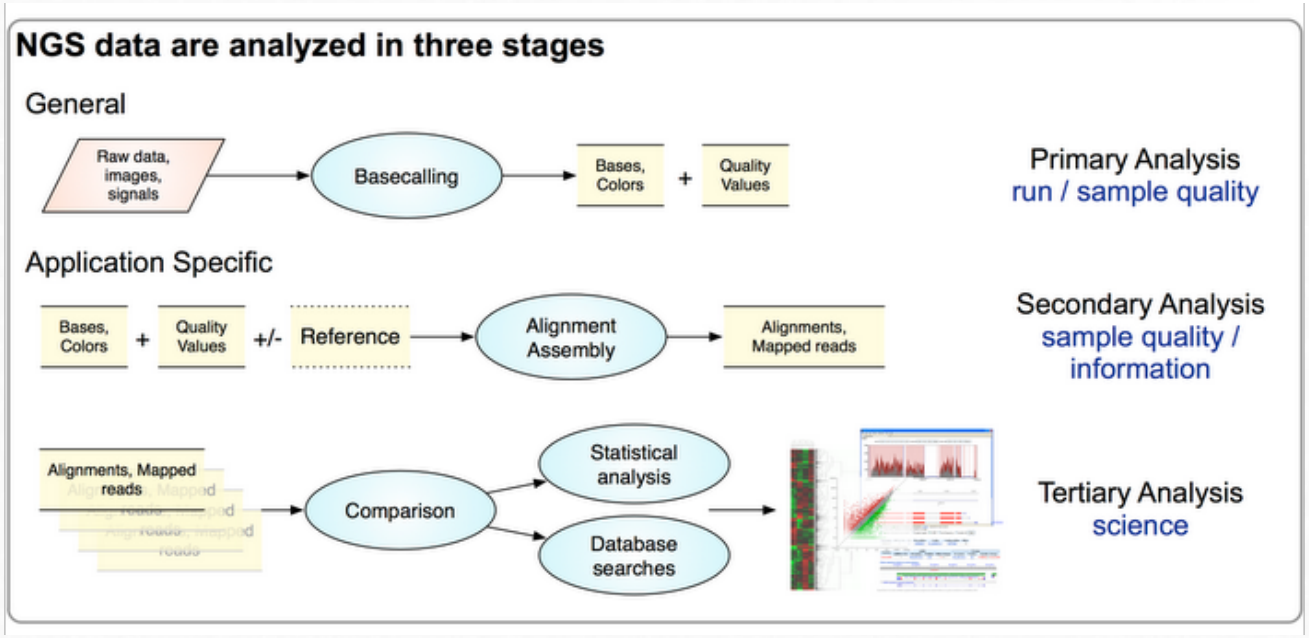
There are many different types of file formats depending on:

- Type of information they contain
  - Raw Sequence files
  - Co-ordinate files
  - Parameter files
  - Annotation files
  - Metadata files
- Sequencing platform
- Analysis stage
- Data source



1. Data formats used in NGS

- Formats are designed to hold sequence data and other information about sequence
- All Sequence formats are ASCII text containing sequence ID, Quality Scores, Annotation details, comments, and other descriptions about sequence

1. Data formats used in NGS

FASTA format

- FASTA format is a text-based format for representing either nucleotide sequences or peptide sequences, in which base pairs or amino acids are represented using single-letter codes
- Header line starts with “>” followed by a sequence ID, and followed by lines of sequence data

```

1. Data formats used in NGS

FASTQ format

- Output of most actual sequencing platforms for raw data
- A text-based format for storing both a **nucleotide sequence** and its corresponding **quality scores**
- Standard file extension for a FASTQ file are .fq and .fastq
- FASTQ files are uncompressed and quite large because they contain the following information for every single sequencing read.
- Compressed files are also possible: fastq.gz

1. Data formats used in NGS

FASTQ format

- File structure. 4 lines:
  - @ followed by the read ID and possibly information about the sequencing run
  - sequenced bases
  - + (perhaps followed by the read ID again, or some other description)
  - quality scores for each base of the sequence (ASCII-translated Phred scores)

```
@Seq description
GATTTGGGGTTCAAAGCAGTATCGATCAAATAGTAAATCCATTTGTTCAACTCACAGTTT
+
!''*(((((***+))%%%++)(%%%%).1***-+*''))**55CCF>>>>>>CCCCCCC65
```

1. Data formats used in NGS

Vall d'Hebron
Institut de Recerca

FASTQ format

Phred Scores

- Sequencing systems assign quality scores to each peak, that represents the error probability that an individual base call is incorrect.
- Phred scores provide log(10)-transformed error probability values:

  If p is probability that the base call is wrong the Phred score is $Q = .10 \cdot log_{10} p$

PHRED Quality Score	Probability of incorrect base call	Base call accuracy
10	1 in 10	90 %
20	1 in 100	99 %
30	1 in 1000	99.9 %
40	1 in 10000	99.99 %
50	1 in 100000	99.999 %

1. Data formats used in NGS

Vall d'Hebron
Institut de Recerca

- The base calling (A, T, G or C) is performed based on Phred scores.
- Ambiguous positions with Phred scores <= 20 are labeled with N.
- To assign each base a unique score identifier (instead of numbers of varying character length), Phred scores are typically represented as ASCII characters.
- Different sequencing platforms may use different ASCII ranges for Phred encoding

Description	ASCII characters		Quality score	
	Range	Offset	Type	Range
Solexa/early Illumina (1.0)	59 to 126 (; to ~)	64	Solexa	-5 to 62
Illumina 1.3+	64 to 126 (@ to ~)	64	Phred	0 to 62
Sanger standard/Illumina 1.8+	33 to 126 (! to ~)	33	Phred	0 to 93

Base call quality scores are represented with the Phred range. Different Illumina (formerly Solexa) versions used different scores and ASCII offsets. Starting with Illumina format 1.8, the score now represents the standard Sanger/Phred format that is also used by other sequencing platforms and the sequencing archives.

1. Data formats used in NGS

SAM / BAM formats

- The **Sequence Alignment/Map (SAM)** format is a generic nucleotide alignment format that describes the alignment of sequencing reads to a reference.
- SAM files typically contain:
  - a short header section with information about the genomic loci of each read
  - a very long alignment section where each row represents a single read alignment.
  - Each alignment line has 11 mandatory fields for essential alignment information such as mapping position, and variable number of optional fields for flexible or aligner specific information

https://samtools.github.io/hts-specs/SAMv1.pdf

1. Data formats used in NGS

Vall d'Hebron
Institut de Recerca

Mandatory Alignment Section Fields

Position	Field	Description
1	QNAME	Query template (or read) name
2	FLAG	Information about read mapping (see next section)
3	RNAME	Reference sequence name. This should match a @SQ line in the header.
4	POS	1-based leftmost mapping position of the first matching base. Set as 0 for an unmapped read without coordinate.
5	MAPQ	Mapping quality of the alignment. Based on base qualities of the mapped read.
6	CIGAR	Detailed information about the alignment (see relevant section).
7	RNEXT	Used for paired end reads. Reference sequence name of the next read. Set to "=" if the next segment has the same name.
8	PNEXT	Used for paired end reads. Position of the next read.
9	TLEN	Observed template length. Used for paired end reads and is defined by the length of the reference aligned to.
10	SEQ	The sequence of the aligned read.
11	QUAL	ASCII of base quality plus 33 (same as the quality string in the Sanger FASTQ format).
12	OPT	Optional fields (see relevant section).

Vall d'Hebron
Institut de Recerca

SAM / BAM formats

- A **BAM file** is a binary version of a SAM file.
- Both contain identical information about reads and their mapping.
- A BAM file requires a header but a SAM file may not have one.
- Many operations (such as sorting and indexing) work only on BAM files.
- For almost any application that requires SAM input, this can be created on the fly from a BAM,
- BAM files take up much less space than SAM files.
- For archiving purposes, keep only the BAM file. The SAM file can easily be regenerated (if ever needed).

1. Data formats used in NGS

Vall d'Hebron
Institut de Recerca

BED / GFF / GTF formats

- Formats for genome annotations
- One line per genomic feature
- The **BED format** is the simplest way to store annotation tracks. It has three required fields (chromosome, start, end) and up to 9 optional fields (name, score, strand, thickStart, thickEnd, itemRgb, blockCount, blockSizes, blockStarts).

```
# 6-column BED file defining transcript loci
chr1   66999824   67210768   NM_032291 0 +
chr1   33546713   33586132   NM_052998 0 +
chr1   25071759   25170815   NM_013943 0 +
chr1   48998526   50489626   NM_032785 0 -
```

1. Data formats used in NGS

BED / GFF / GTF formats

- The **General Feature Format (GFF) and General Transfer Format (GTF)** has nine required fields; the first three fields form the basic name, start, end tuple that allows for the identification of the location in respect to the reference genome.

Sample GTF output from Ensembl data dump:

```
1 transcribed_unprocessed_pseudogene  gene        11869 14409 . + . gene_id "ENSG00000223972"; gene_name "DDX11L1"; gene_source "havana"; gene_biotype "transcribed_unprocessed_pseudogene";
1 processed_transcript                transcript  11869 14409 . + . gene_id "ENSG00000223972"; transcript_id "ENST00000456328"; gene_name "DDX11L1"; gene_sourc e "havana"; gene_biotype "transcrib
```

Sample GFF output from Ensembl export:

```
X       Ensembl Repeat  2419108 2419128 42      .       .       hid=trf; hstart=1; hend=21

X       Ensembl Repeat  2419108 2419128 0       .       .       hid=dust; hstart=2419108; hend=2419128
X       Ensembl Pred.trans.     2416676 2418760 450.19  -       2       genscan=GENSCAN00000019335
X       Ensembl Variation       2413425 2413425 .       +       .
X       Ensembl Variation       2413805 2413805 .       +       .
```

http://m.ensembl.org/info/website/upload/gff.html

1. Data formats used in NGS

Vall d'Hebron
Institut de Recerca

1. **reference sequence**: coordinate system of the annotation (e.g., "Chr1")
2. **source**: describes how the annotation was derived (e.g., the name of the annotation software)
3. **method**: annotation type (e.g., gene)
4. **start position**: 1-based integer, always less than or equal to the stop position
5. **stop position**: for zero-length features, such as insertion sites, start equals end and the implied site is to the right of the indicated base
6. **score**: e.g., sequence identity
7. **strand**: "+" for the forward strand, "-" for the reverse strand, or "." for annotations that are not stranded
8. **phase**: codon phase for annotations linked to proteins; 0, 1, or 2, indicating the frame, or the number of bases that should be removed from the beginning of this feature to reach the first base of the next codon
9. **group**: contains the class and ID of an annotation which is the logical parent of the current one ("feature is composed of")

1. Data formats used in NGS

VCF format

- Variant Call Format (VCF) is a text file format.
- It contains meta-information lines, a header line, and then data lines each containing information about a position in the genome.
- Also has the ability to contain genotype information on samples for each position.
- The header line names the 8 fixed, mandatory columns.

1. #CHROM
2. POS
3. ID
4. REF
5. ALT
6. QUAL
7. FILTER
8. INFO
